ABSTRACT OF THE DISCLOSURE

A framework for a business application system, which is used for constructing the business application system, is described by an object-oriented language having characteristics of abstraction and inheritance.

- 5 The framework includes an abstract class group 10 having abstractly defined the structure and behavior of the business application system, and a common component group 20 including a plurality of common components commonly for use in the business application system. The abstract class group 10 includes a system core class group 11 having
- 10 abstractly defined the basic structure and behavior of the business application system, and a screen system class group 12, a report system class group 13 and a business logic system class group 14, which inherit the system core class group 11. Thus, it is possible to provide a method for constructing a business application system, which can commonly use and
- 15 reuse the basic structure of the overall business application system and which can flexibly and easily change and extend the business application system in accordance with a specification change.
